

The California Report — phased plan

Converting the 288-page Ladera investigation into a condensed, area-based **California report**, then a 5–10 minute video script, then the full B-roll package.

LEHRP · plan of record · July 2026 · supersedes the Ladera-centric structure

Discipline gates apply to every phase: hypothesis-neutral · A1–D source grade on every claim · counter-evidence mandatory · no residential addresses or coordinates · aggregate health data only · confidence badges · no sensationalism · standard disclaimer on every section and in the video description. No contamination is asserted anywhere; no California dip-site soil has ever been tested.

Sections

- Phase 1 — The California Report (restructure + condense)
 - 1.1 Frame & section order · 1.2 Area template · 1.3 Environmental-review tables · 1.4 Schools · 1.5 Figures · 1.6 The condense pass · 1.7 Output format
- Phase 2 — The video script (5–10 min)
- Phase 3 — B-roll package
- Sequencing & effort

Phase 1 — The California Report

1.1 Frame & section order

One statewide story: a state-mandated arsenical cattle-dipping program (1907 → **Orange County federally released March 1912** — now dated from the primary press), never inventoried, never marked, never follow-up tested — examined **area by area**:

1. **LADERA RANCH** — priority area
2. **BELL CANYON / COTO DE CAZA** — the documented Joplin dip ranch (1909 patent = NE Coto, partly built over; 1938 ranchstead in Bell Canyon on still-open ground)
3. Newport Coast · 4. Irvine · 5. Eastbluff / Back Bay / Santa Ana Heights
6. Statewide tier — one spread per probability-map community: San Juan Capistrano, Yorba Linda, Anaheim Hills, **Long Beach (Los Cerritos — documented; Los Alamitos)**, Camp Pendleton, Simi Valley, Fillmore, Rancho Santa Fe/Del Mar, Rancho Bernardo, Rancho Peñasquitos, Rancho Cucamonga, Jurupa Valley, Valencia/Santa Clarita, Tejon, Miller & Lux

7. Program history (1907 law · USDA 8-lb formula · quarantine geography · the March-1912 releases)
8. What other places did (Florida/SE-US government-run & logged · NSW register) · 9. Arsenic mass-balance model · 10. Methods & sources

1.2 Standard area-section template

- Ranch-era history (graded) → dipping-evidence tier (documented / highly probable / likely / plausible)
- **All imagery & historical photos** — aerials 1929–1953, then/now pairs, patent overlays, satellite tiles, newspaper clippings, licensed archival ranch photos — figured for visual engagement
- Environmental-review table (1.3) → schools roster (1.4) → honest limits & counter-evidence
- Corrections carried through: Joplin patent geography; Osterman de-attributed; tonnage ceiling

1.3 The environmental-review table (per area) KEY ASK

Field	Content (Ladera example)
What review exists	1995 Michael Brandman Phase I (Antonio Pkwy EIR App. H) · 2003 Oso Grande School Phase 1 + Addendum (EnviroStor 30020004)
Did it sample soil?	NO — paper review only (verified at source, this project)
Analytes tested	None (Ladera). Comparators: Coto TTM 17325 Phase II = lead + PAH (shooting range); Irvine/Mission Viejo school sites = OCPs + arsenic + lead (DTSC orchard guidance)
Arsenic tested?	Ladera: never . Elsewhere: only under orchard guidance
Which arsenic signature	⚠ Lead-arsenate (orchard/crop pesticide → arsenic <i>with</i> lead) vs arsenic trioxide ("white arsenic" — the cattle-dip poison → arsenic with little/no lead). No California test anywhere has ever targeted the dip signature.
Verdict	tested-and-cleared / tested-for-the-wrong-source / never-tested

1.4 Schools — list every school, per area

Every school in each area with its EnviroStor status (most have **no entry at all**; Oso Grande is Ladera's only entry — paper-only). Ladera roster to verify & publish: Oso Grande ES · Ladera Ranch ES · Ladera Ranch MS · Chaparral ES · private/charter adds. Coto/Trabuco: Wagon Wheel ES · Tijeras Creek ES · Arroyo Vista K-8 + adjacents. Same roster exercise for every statewide area.

1.5 Required figures (built — reuse)

CA dipping-probability map (must-include) · CA satellite overview + 19-tile atlas ·

Ladera 1929–2022 time-series · Ladera best-guess + under-neighborhood + node-A zoom ·

Joplin patent overlay + 1938/1953/modern triptych + zooms · OC dipping-geography map ·

1912 infestation plate · mass-balance map · 60-image statewide gallery. *New*: per-area

school-status boards · env-review comparison graphic · FL-vs-CA process diagram.

1.6 The condense pass USER DIRECTIVE

Shorter despite the statewide scope — target **~120–150 pages** (from 288):

- One methods chapter; boilerplate/disclaimer collapsed to a footer line + once per section
- Merge duplicative framework chapters into one tight intro; delete recap and process narration — findings + sources only
- Area cap ~6–10 pp (priority areas ≤15), figure-led; tables replace prose lists
- Kill weak/duplicate figures — strongest visual per point

1.7 Output format USER DIRECTIVE

(a) HTML broken down by section — an index page + one cross-linked HTML page per area/section, each self-contained with its figures; **(b) a separate single PDF** of the whole condensed report. Every migrated claim keeps its `source_id`; new claims (quarantine lift, Levensgood ID, GLO patent, EnviroStor/GeoTracker first-hand reads) registered in `sources.csv` first.

Phase 2 — The video script (5–10 min, ~1,100–1,500 words)

1. **Cold open** — 1908, Orange County: the county-ordered dip that killed six of Levensgood's cattle; herd bought from Joplin of Bell Canyon (all primary-press sourced)
2. **The program** — 1907 law; 8 lb white arsenic / 500 gal; quarantine maps; ~50–150 vats; OC released March 1912
3. **The chemistry** — arsenic is an element, it does not decay; ~100–500 lb per heavily-used vat MODEL EST.
4. **The contrast (core beat)** — Florida/SE: **government-run**, state crews built and operated the vats, sites **logged** (Florida 3,000+ known; NSW later built a register + buyer notification). California: **each ranch built and ran its own vat** from a mailed federal circular — **no agency ever recorded a single location**
5. **The decades of silence** — no follow-up in the 30s–90s; Phase-I practice reaches ~1950 aerials; dipping ended 1912 → structurally invisible to every later review

6. **The areas** — Ladera (built on the range; paper-only reviews; arsenic never tested) · Coto/Bell Canyon (the documented ranch: part built over, home place still open ground) · the statewide map
7. **The wrong-arsenic problem** — where CA did test, it tested the orchard (lead-arsenate) signature, never the dip signature
8. **The resolver** — one soil test on documented ground; approved-language close + disclaimer

Deliverable: `media/video/SCRIPT_california.md` with per-beat B-roll callouts and on-screen citations. Tone: measured, archival — no fear cues, no music stings on health claims.

Phase 3 — B-roll package

Inventory: catalog every existing visual into `media/broll/INDEX.md`, mapped beat-by-beat to the script.

Reuse: CA probability map · satellite atlas/overview · Ladera time-series + zooms · Joplin triptych/zooms · dipping-geography map · 1912 plate · model map · statewide gallery.

New to build:

- **FL/SE-vs-CA process comparison boards** (government-run & logged vs ranch-run & never recorded)
- **Timeline board** 1906→2026 (program → Mar-1912 release → decades of silence → build-out 1968–2006 → zero arsenic tests)
- **Newspaper-clipping pulls** — 27 May 1908 dip article · Levengood claim · "QUARANTINE RAISED" 1912 · Joplin obituary 1933
- **School boards** per area with EnviroStor status badges
- **Two-arsenics explainer** — lead-arsenate (As+Pb) vs arsenic trioxide (As-only)
- 1911 USDA vat warning-sign reproduction · 4K ken-burns crops of the large aerals

Everything carries confidence badges and "model estimate ≠ measurement" chyrons where applicable.

Sequencing & effort

Step	What	Est.
1a	Register new sources; migrate corrections	1 session

1b	Priority chapters: Ladera + Bell Canyon/Coto (full template)	1–2 sessions
1c	Remaining areas + program/history chapters	2–3 sessions
1d	Env-review tables + verified school rosters	1 session
1e	Condense pass → sectioned HTML + single PDF, QA, publish	1 session
2	Video script draft → revision	1 session
3	B-roll inventory + new boards	1–2 sessions

Physical-archive results (OC Archives 94IC011 + county-vet files, Sherman Library, State Archives, Audubon Starr Ranch) slot into 1b–1d as they arrive; the report ships with "records pending" flags rather than waiting on them.

This platform is an independent research and data-organization project. It does not provide medical advice and does not establish that any party caused any illness. Geographic and temporal overlap does not establish exposure or causation.
