

EXHIBIT — What a century-old arsenic dip vat looks like

Every photograph on this page was taken and published by the Florida Department of Environmental Protection - the one state that inventoried its ~3,400 vats. Florida's assessment found 11 of 12 tested sites exceeded acceptable soil arsenic. The state's report records disused vats reused as 'swimming holes for children.'

A vat still holding water a century on - note the stepped cattle exit at the far end (1911 federal spec)

Relevance: California ran the same federal program on the land that became South Orange County. California never inventoried its sites. This is what an unrecorded site looks like
